About

I'm a self-taught software engineer with 3 years of professional experience building production software across the full stack. I got my start through a gap-year internship at Accessia, where I chose to stay rather than take my place at Loughborough University – Accessia created a bespoke role to retain me, which I took as a strong signal to back practical experience over a formal qualification.

Over my time there I worked across TypeScript/React frontends, Python backends, and Kotlin Android apps, owning features end-to-end from requirements through to deployment. My time there came to an end when Accessia ceased trading in early 2026, and I'm now looking for my next role.

Employment History

Accessia

September 2023 – March 2026

Software Engineer (previously Intern; Degree Apprentice at QMUL, Sep 2024 – Dec 2025)

London, UK

- Built and maintained production full-stack web applications, owning features end-to-end from requirements through to deployment (TypeScript/React).
- Engineered a real-time door-snapping interface requiring precise interaction design and performance optimisation, reducing floorplan deployment time and improving drawing accuracy (TypeScript/React, WebSockets).
- Built and consumed REST APIs, including automating back-end database calls and building internal tooling to surface data for front-end use (Python).
- Debugged and resolved authentication issues including integrating with Azure AD for SSO using SAML, working across frontend and backend to deliver the solution.
- Used SQL to query production databases and Grafana to pull and analyse logs when investigating live incidents.
- Developed and maintained two Kotlin Android applications, including a production client-facing app built collaboratively with the team.
- Maintained codebase quality through active code reviews and comprehensive unit tests.
- Took on on-call duties as part of a company-wide rota (5+ weeks/year), acting as single point of contact for live user issues and meeting business-defined SLAs including sub-12-hour response times.
- Triaged incoming support requests using Jira, diagnosing issues end-to-end and communicating with non-technical end users, IT admins, and external clients.

Education

Watford Grammar School for Boys

2016 – 2023

London, UK

A Levels: Computer Science (A), Mathematics (A), Further Mathematics (B)

GCSEs: 11 subjects at grades 7–9.

Technical Projects

Carrot Bot (Discord)

Python, JavaScript, TypeScript, GCP, MongoDB

- What started as a Python script on a Raspberry Pi for a few friends has grown into a community tool used by over 500 members, migrated to GCP to handle the increased load.
- Built real-time features using WebSockets and integrated MongoDB for data storage, scheduling, and third-party API connectivity.
- Rewrote the codebase across three iterations (Python, Node.js, TypeScript), each time improving reliability and maintainability as usage grew.
- Implemented an automatic deployment pipeline so merging to main triggers a redeployment, keeping the live bot in sync with the latest changes without manual intervention.
- Structured the codebase for self-hosting, with documentation so other developers can clone and run their own instances.
